PHP

esade

- **PHP** is a general purpose programming language designed for web development in the back end (server side), typically having SQL instructions embedded for database data manipulation.

- PHP instructions are embedded in HTML pages.
- PHP processor takes the HTML page to be presented and executes (interprets) the PHP code, to add the dynamic information in it. PHP can retrieve information from a database (having SQL code embedded) and process the information to be included in the HTML page before send to the browser (user).
- PHP processor transforms the PHP code and only sends to the browser HTML instructions (possibly having included JavaScript instructions).

Creating Dynamic Web Pages

3rd Edition

Programming PHP

Kevin Tatroe, Peter MacIntyre & Rasmus Lerdorf

Foreword by Michael Bourque

O'REILLY

Programming PHP: Creating Dynamic Web Pages Third Edition

by [Kevin Tatroe](#) (Author), [Peter MacIntyre](#) (Author), [Rasmus Lerdorf](#) (Author)

★★★★☆ 70 ratings

There is a newer edition of this item:

Programming PHP: Creating Dynamic Web Pages

\$35.49

★★★★☆ (38)

In Stock.

This updated edition teaches everything you need to know to create effective web applications with the latest features in PHP 5.x. You'll start with the big picture and then dive into language syntax, programming techniques, and other details, using examples that illustrate both correct usage and common idioms.

If you have a working knowledge of HTML, the authors' many style tips and practical programming advice will help you become a top-notch PHP programmer.

- Get an overview of what's possible with PHP programs
- Learn language fundamentals, including data types, variables, operators, and flow control

PHP statements

- `$mail = john.doe@esade.edu // defines $mail variable`
- `echo("xxxxx"); // it shows the text xxxxx in the built HTML page`
 - Ex. `echo("<h1>Hello</h1>");`
- `exit(); // it stops executing the program (building the HTML page)`
- `die("xxxxx"); // it is equal to : echo("xxxxx"); exit();`
- `session_start(); // start the session to use session variables`
- `$_SESSION['userid'] = $user; // Defines the session variable 'userid'`
- `$id_user = $_SESSION['userid']; // Retrieve userid from the Session variable defined in the previous php page`

Managing MySQL with PHP

```
// Define connection variables
$host = "localhost";
$db_username = "root";
$db_password = "";
$db_name = "mydatabase";

// Connect to the Database. Store the connection in $conn

$conn = mysqli_connect ($host, $db_username, $db_password, $db_name) or die ('Connection Error');

// execute query and store the list of users into a recordset $rs
$rs = mysqli_query($conn, 'SELECT * FROM users');
```

```
mysqli_num_rows($rs) // Number of rows retrieved by query
```

```
$user = mysqli_fetch_row($rs); // fetch 1st row of the recordset
```

userID	name	password	Gender	email	conditions	prefixphone	phone
6	Peter Gabriel	peter	M	peter@gabriel.com	Y	44	95555888

```
$user[0]; $user[1]; $user[2]; $user[3]; .....
```

```
mysqli_data_seek($rs, 0); // positions the pointer on the first record
```

HTML Forms and PHP

new_user.html

```
<form method="POST" action="user_reg.php">
<h4>Form Register</h4>
  Name : <input type="text" name="firstname" >
  Email: <input type="text" name="email" >
  <input type="submit" value="Sing Up">
</form>
```

User_reg.php

```
<?php
$f_name = $_POST['firstname'];
$e_mail = $_POST['email'];

echo "Hello $fname";

?>
```

Name:	John
Email:	john@esade.edu
Sign Up	

```
$f_name ->John
$e_mail ->John@esade.edu
```

Connection to the database

Each php page must establish a connection to the database.

db.php

```
<?php
    session_start(); // start a new session

    $conn = mysqli_connect(        // connect to the database

        'localhost',              // host (machine) where the database is located. In our case it is our local server
        'root',                   // user with permission to access the database
        'root',                   // password of this user
        'mkt_tasks'               // database name

    ) or die(mysqli_error($mysqli)); // End of program if conex not successfull

?>
```
