

DEPLOYING YOUR APP

Step-by-step Plesk Guide

How to upload the Task Manager application to a live server using the Plesk control panel

BEFORE YOU START — WHAT YOU NEED

What	Where to get it
Plesk control panel URL	Provided by your teacher (looks like <code>https://server-name:8443</code>)
Plesk username and password	Provided by your teacher — one set of credentials per group
Application files on your PC	The folder containing all .php, .html, .css files and the images/subfolder

 Do steps 2–5 in order. The database must exist before you upload and run the files.

1 LOG IN TO PLESK

Open your web browser (Chrome, Firefox, etc.).

Go to the Plesk URL your teacher gave you.

Enter your username and password, then click Log in.

2 CREATE THE DATABASE

In the Plesk home screen, click Databases.

If you do not see it directly, click on your domain name first.

Click Add Database.

Fill in the form:

- Database name → type `tasks`
- Database server → leave it as `localhost`

Click OK.

 The database name must be exactly `tasks` (lowercase) — the application code uses that name.

3 CREATE A DATABASE USER

After creating the database, click Add User (inside the database you just created).

Fill in:

- Database user name → for example `tasks_user`
- Password → choose one and write it down — you will need it in Step 5
- Confirm password → repeat the same password

Make sure the user has All Privileges on the tasks database.

Click OK.

⚠ Keep a note of these three values: database name (`tasks`), database username, and password.

Import the Database using “Import” TAB in PHPMyAdmin. Use the dump file *tasks.sql*

✓ If you see a green success banner, the tables were created correctly. You can check them in the left column of phpMyAdmin.

5 EDIT THE DATABASE CONNECTION FILE (DB.PHP)

On your computer, open the file `db.php` with any text editor (Notepad, VS Code, etc.).

Find these four lines inside the `mysqli_connect()` call:

```
'localhost',    // host
'root',         // ← change to your database username
'root',         // ← change to your database password
'tasks'         // database name — leave this as it is
```

Replace the two values marked with arrows with the username and password you chose in Step 3. Example:

```
'localhost',
'tasks_user',
'MyPassword123',
'tasks'
```

Save the file.

⚠ Do not change `localhost` or `tasks` — only the username and password lines.

6 UPLOAD THE FILES USING THE PLESK FILE MANAGER

Back in Plesk, click Files (or File Manager) in the main menu.

Navigate into the httpdocs folder — this is the public web root of your domain.

Create a new folder inside httpdocs:

- Click New Directory → name it tasks → click OK.

Open the tasks folder you just created.

Click Upload and select all the .php, .html, and .css files from your computer.

Now create a subfolder for images:

- Click New Directory inside tasks → name it images → click OK.

Open the images folder and upload the three image files: wall.png, edit.png, delete.png.

When finished, the file structure on the server should look exactly like this:

```
httpdocs/  
└─ tasks/  
    ├── db.php  
    ├── delete_task.php  
    ├── edit.php  
    ├── error_login.html  
    ├── login.html  
    ├── modify_task.php  
    ├── new_task.html  
    ├── new_task.php  
    ├── new_user.html  
    ├── query_error.html  
    ├── style.css  
    ├── tasks_list.php  
    ├── user_exist.html  
    ├── user_reg.php  
    ├── verify.php  
    ├── welcome.html  
    └─ images/  
        ├── delete.png  
        ├── edit.png  
        └─ wall.png
```

7 OPEN THE APPLICATION IN YOUR BROWSER

Open a new browser tab.

Type the address of your application:

```
http://your-domain.com/tasks/new_user.html
```

Replace your-domain.com with the domain or IP address of your server (provided by your teacher).

You should see the registration form. Create an account, tick the "Administrator" box if you want admin access, and click Register. If the task list appears — the app is running correctly!

COMMON PROBLEMS AND HOW TO FIX THEM

Problem	Most likely cause	Fix
Page does not load at all	Wrong folder name or wrong location	Check that the folder is called tasks and is inside httpdocs
Database connection error	Wrong credentials in db.php	Re-open db.php and double-check the username and password (Step 5)
"Error in the query" message	Tables do not exist yet	Go back to Step 4 and run the SQL script again in phpMyAdmin
Images are missing	images/ folder is in the wrong place	Make sure images/ is inside tasks/, not alongside it
Blank white page	PHP error — usually a typo in db.php	Recheck db.php for any missing quotes or misspelled values
Login always fails	No users in the database	Register a new account first via new_user.html

QUICK REFERENCE — 7 STEPS AT A GLANCE

1	Log in to Plesk	Use the URL and credentials from your teacher
2	Create the database	Name it exactly: tasks
3	Create a database user	Note down the username and password
4	Run the SQL script in phpMyAdmin	Creates the users and task tables
5	Edit db.php	Put your database username and password in it
6	Upload files via File Manager	All files go inside httpdocs/tasks/
7	Open the app in your browser	Go to http://your-domain/tasks/new_user.html
